Foreword

ISO (the International Organization for Standardization) and IEC (the International Electrotechnical Commission) form the specialized system for worldwide standardization. National bodies that are members of ISO or IEC participate in the development of International Standards through technical committees established by the respective organization to deal with particular fields of technical activity. ISO and IEC technical committees collaborate in fields of mutual interest. Other international organizations, governmental and non-governmental, in liaison with ISO and IEC, also take part in the work. In the field of information technology, ISO and IEC have established a joint technical committee, ISO/IEC JTC 1.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.

The main task of the joint technical committee is to prepare International Standards. Draft International Standards adopted by the joint technical committee are circulated to national bodies for voting. Publication as an International Standard requires approval by at least 75 % of the national bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO and IEC shall not be held responsible for identifying any or all such patent rights.

ISO/IEC 13157 was prepared by Ecma International (as ECMA-385) and was adopted, under a special “fast-track procedure”, by Joint Technical Committee ISO/IEC JTC 1, *Information technology*, in parallel with its approval by national bodies of ISO and IEC.

Introduction

This International Standard specifies common NFC-SEC services and a protocol. This International Standard is a part of the NFC-SEC series of standards. The NFC-SEC cryptography standards of the series complement and use the services and protocol specified in this International Standard.

Information technology — Telecommunications and information exchange between systems — NFC-SEC: NFCIP-1 Security Services and Protocol

1 Scope

This International Standard specifies the NFC-SEC secure channel and shared secret services for NFCIP-1 and the PDUs and protocol for those services.

NOTE 1: NFC-SEC is exclusively designed and optimized for the data exchange protocol of ISO/IEC 18092.

NOTE 2: This standard does not address application specific security requirements (as typically needed for smart card related use cases and standardized in the ISO/IEC 7816 series). NFC-SEC may complement application specific security requirements of ISO/IEC 7816.

2 Conformance

Conformant implementations employ the security mechanisms in the NFC-SEC cryptography standards identified by the selected PIDs using one or more of the services specified in this International Standard.

Conformant implementations that use the NFCIP-1 protocol shall also conform to the requirements in Annex B.

3 Normative references

The following referenced documents are indispensable for the application of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

ISO/IEC 13158:2009, *Information technology -- Telecommunications and information exchange between systems -- NFC-SEC-01: NFC-SEC Cryptography Standard using ECDH and AES (also published by Ecma as Standard ECMA-386)*

ISO/IEC 18092:2004, *Information technology -- Telecommunications and information exchange between systems -- Near Field Communication -- Interface and Protocol (NFCIP-1) (also published by Ecma as Standard ECMA-340)*

4 Terms and definitions

For the purpose of this International Standard, the terms and definitions specified in ISO/IEC 18092, ISO/IEC 7498-1, ISO 7498-2, ISO/IEC 10731 and ISO/IEC 11770-1 apply. In addition, the following terms and definitions apply.

4.1

Connection

(N)-connection as specified in ISO/IEC 7498-1

4.2

Entity

(N)-entity as specified in ISO/IEC 7498-1

4.3

Link key

Secret key securing communications across a secure channel

4.4

NFC-SEC User

Entity using the NFC-SEC service

4.5

Protocol

(N)-protocol as specified in ISO/IEC 7498-1

4.6

Recipient

NFC-SEC entity that receives ACT_REQ

4.7

Secure channel

Secure NFC-SEC connection

4.8

Sender

NFC-SEC entity that sends ACT_REQ

4.9

Service

(N)-service as specified in ISO/IEC 7498-1

4.10

Shared Secret

Secret shared by two peer NFC-SEC Users

5 Conventions and notations

The following conventions and notations apply in this document unless otherwise stated.

5.1 Representation of numbers

The following conventions and notations apply in this document unless otherwise stated.

- Letters and digits in parentheses represent numbers in hexadecimal notation.
- The setting of bits is denoted by ZERO or ONE.

- Numbers in binary notation and bit patterns are represented by sequences of 0 and 1 bits shown with the most significant bit to the left. Within such strings, X may be used to indicate that the setting of a bit is not specified within the string.
- In octets the lsb is bit number 1, the msb bit number 8.

5.2 Names

The names of basic elements, e.g. specific fields, are written with a capital initial letter.

6 Acronyms

For the purposes of this International Standard, the acronyms specified in ISO/IEC 18092 apply. Additionally, the following acronyms apply.

ACT_REQ	Activation Request PDU
ACT_RES	Activation Response PDU
ENC	Encrypted Packet PDU
ERROR	Error PDU
lsb	least significant bit
LSB	Least Significant Byte
msb	most significant bit
MSB	Most Significant Byte
MSG	MesSaGe code
PCI	Protocol Control Information (see ISO/IEC 7498-1)
PDU	Protocol Data Unit (see ISO/IEC 7498-1)
PID	Protocol Identifier
RFU	Reserved for Future Use
SCH	Secure Channel service
SDL	Specification and Description Language (as specified in ITU-T Z.100)
SDU	Service Data Unit (see ISO/IEC 7498-1)
SEP	Security Exchange protocol Parameter
SN	Sequence Number
SNV	SN variable
SSE	Shared Secret Service
SVC	SerVicE code

TMN	Terminate PDU
VFY_REQ	Verification Request PDU
VFY_RES	Verification Response PDU

7 General

NFC-SEC as illustrated in Figure 1 follows concepts specified in the OSI reference model specified in ISO/IEC 7498-1.

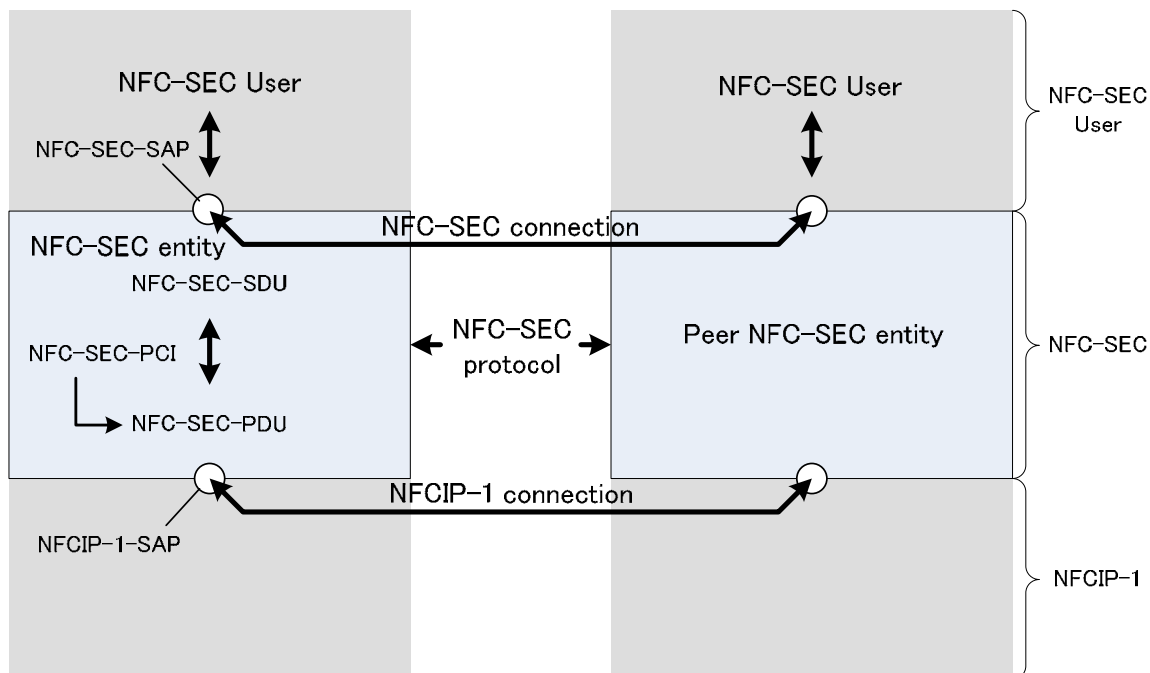

Figure 1 – NFC-SEC architecture

NFC-SEC Users invoke and access the NFC-SEC services through NFC-SEC Service Access Points (NFC-SEC-SAP). NFC-SEC entities obtain NFC-SEC-SDUs (requests) from NFC-SEC Users and return NFC-SEC-SDUs (confirmations) to them.

This International Standard specifies the Secure Channel Service (SCH) and the Shared Secret Service (SSE).

To provide the NFC-SEC services, Peer NFC-SEC entities exchange NFC-SEC-PDUs by conforming to the NFC-SEC protocol over NFC-SEC connections.

Peer NFC-SEC entities communicate with each other accessing the NFCIP-1 data service through NFCIP-1 Service Access Points (NFCIP-1-SAP), sending and receiving NFC-SEC-PDUs. A NFC-SEC-PDU consists of NFC-SEC Protocol Control Information (NFC-SEC-PCI) and a single NFC-SEC-SDU.

8 Services

This clause specifies two services, SSE and SCH, that NFC-SEC provides to the NFC-SEC User. When invoked, these services enable the cryptographic protected transmission of NFC-SEC User messages between the peer entities by means of a protocol described in 9.

Shared secrets established with the services specified below shall be cryptographically uncorrelated from any shared secrets established beforehand or afterwards.

8.1 Shared Secret Service (SSE)

The SSE establishes a shared secret between two peer NFC-SEC Users, which they can use at their discretion.

Invocation of the SSE shall establish a shared secret by the key agreement and key confirmation mechanisms, according to the NFC-SEC cryptography standard identified by the PID.

8.2 Secure Channel Service (SCH)

The SCH provides a secure channel.

Invocation of the SCH shall establish a link key, by derivation from a shared secret established by the key agreement and key confirmation mechanisms, and shall subsequently protect all communications in either direction across the channel, according to the NFC-SEC cryptography standard identified by the PID.

9 Protocol Mechanisms

The NFC-SEC protocol comprises the following mechanisms. Figure 2 specifies the sequence of the protocol mechanisms.

9.1 Key agreement

The peer NFC-SEC entities shall establish a shared secret using ACT_REQ and ACT_RES, according to the NFC-SEC cryptography standard identified by the PID.

9.2 Key confirmation

The peer NFC-SEC entities shall verify their agreed shared secret using VFY_REQ and VFY_RES, according to the NFC-SEC cryptography standard identified by the PID.

9.3 PDU security

PDU security is a mechanism of SCH service only.

The peer NFC-SEC entities shall protect data exchange using ENC, according to the NFC-SEC cryptography standard identified by the PID.

This mechanism shall comprise one or more of the following, as specified in the respective NFC-SEC cryptography standard:

- Sequence Integrity, conforming to the requirements of 12.3;
- Confidentiality;
- Data integrity;
- Origin authentication.

9.4 Termination

The peer NFC-SEC entities shall terminate SSE and SCH using TMN. After Release or Deselect of NFCIP-1, or when the NFCIP-1 device is powered off, SSE and SCH instances shall be terminated. Upon transition to the IDLE state the associated shared secret and the link key shall be destroyed.

Figure 2 – General flow of the NFC-SEC service

10 States and Sub-states

The NFC-SEC protocol machine in Annex A specifies the state transitions for the states and sub-states in Table 1.

Table 1 – State

State	Description
Idle	NFC-SEC is ready to start a new service upon request from the NFC-SEC User or the peer NFC-SEC Entity.
Select	NFC-SEC is awaiting an ACT_RES.
Established	An NFC-SEC Service is requested. The established state contains two sub-states In the Established_Sender sub-state it is awaiting a VFY_RES. In the Established_Recipient Sub-state it is awaiting a VFY_REQ.
Confirmed	An NFC-SEC service is established. The Confirmed State contains two sub-states, In the Confirmed _SSE sub-state, the shared secret is ready to be retrieved. In the Confirmed _SCH sub-state, secure data exchange is ready.

11 NFC-SEC-PDUs

NFC-SEC-PDUs shall be conveyed in NFCIP-1 DEP "Secure Data" PDUs placing the SEP byte into byte 0 of the DEP transport data bytes. The DEP transport data bytes shall contain exactly one NFC-SEC-PDU.

The NFC-SEC-PDU structure is specified in Figure 3.

Figure 3 – Structure of NFC-SEC PDU

Table 2 specifies the *NFC-SEC-PDUs* fields as mandatory (m), prohibited (p), conditional (c). The conditionality (c) is further specified below.

Table 2 – NFC-SEC-PDU Fields

NFC-SEC-PDU	SEP	PID	NFC-SEC Payload
ACT_REQ	m	m	c
ACT_RES	m	p	c
VFY_REQ	m	p	c
VFY_RES	m	p	c
ENC	m	p	c
TMN	m	p	p
ERROR	m	p	c

11.1 Secure Exchange Protocol (SEP)

The 1-byte Secure Exchange Protocol (SEP) field is specified as follows:

- The value of 00b in the SVC indicates that the PDU is part of an SSE exchange. The value of 01b in the SVC indicates that the PDU is part of an SCH exchange.

- The MSG code identifies the PDU type as specified in table 3.
- The RFU bits shall be set ZERO. Receivers shall reject PDUs with RFU bits set to ONE.

Figure 4 specifies the bit assignment.

msb				lsb			
Bit 8	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1
RFU		SVC		MSG			

Figure 4 – Bit assignment of SEP

Table 3 specifies the coding of MSG. The codes not specified Table 3 are RFU.

Table 3 – PDU types and their MSG codes

Code	Name	Description
0000	ACT_REQ	Activation request to request a new service.
0001	ACT_RES	Activation response, to accept a service request.
0010	VFY_REQ	Verification request to submit check values for verification of the Sender's shared secret.
0011	VFY_RES	Verification response to submit check values for verification of the Recipient's shared secret.
0100	ENC	Encrypted packet for secure data exchange.
0110	TMN	Terminate request to terminate a service.
1111	ERROR	Error an Indication of an error..

11.2 Protocol Identifier (PID)

PIDs are 8-bit values that identify NFC-SEC cryptography standards or specifications. PID values are registered at

<http://www.ecma-international.org/publications/standards/Ecma-386.html>.

The PID field is present in the ACT_REQ, but omitted in all other PDUs.

11.3 NFC-SEC Payload

The TMN PDU shall contain no NFC-SEC Payload field. The NFC-SEC Payload field shall consist of an integer number of octets. Its use in the ERROR PDU is specified in the Error sub-clause below. Its use in all other PDUs depends on the PID and is specified in the respective NFC-SEC cryptography standard.

11.4 Terminate (TMN)

The TMN PDU consists of the SEP field only.

11.5 Error (ERROR)

The ERROR PDU starts with the SEP field and if it contains a payload, this payload shall contain a zero-terminated byte string in the NFC-SEC Payload field.

12 Protocol Rules

This clause specifies rules for the NFC-SEC protocol.

12.1 Protocol Errors

- When a NFC-SEC entity receives a PDU in a state where it is not allowed, it shall respond with an ERROR PDU.
- When a NFC-SEC entity receives a PDU that it does not support or with invalid contents as specified in NFC-SEC cryptography standard, it shall respond with an ERROR PDU.
- When a NFC-SEC entity receives or sends an ERROR PDU, it shall set the protocol state to Idle.
- When a NFC-SEC entity receives or sends an ERROR PDU, it shall send an ERROR SDU to the NFC-SEC User.
- When a NFC-SEC entity receives a SDU in a state where it is not allowed or with invalid contents, it shall respond with an ERROR SDU and leave the state unchanged.

12.2 Interworking Rules

- A NFC-SEC implementation may set an upper bound on the NFC-SEC-SDU length. Send Data requests specified in A.2 with longer SDUs shall be rejected.
- One NFC-SEC-PDU shall contain exactly one NFC-SEC-SDU.
- NFC-SEC Entities shall discard any duplicate NFC-SEC-PDUs, as specified in the Sequence Integrity clause.

12.3 Sequence Integrity

NFC-SEC cryptography standards providing sequence integrity shall specify the sequence integrity mechanism in conformance to the following:

- Each NFC-SEC Entity shall maintain its SNV.
- Upon SCH establishment, the Recipient shall initialise its SNV with the same initial value as the Sender's SNV as specified in the NFC-SEC cryptography standard identified by the PID.
- The NFC-SEC cryptography standard identified by the PID specifies a range on the SNV values.
- Upon sending of ENC, the NFC-SEC Entity shall increase their SNV by 1, and then place it into the SN field.
- The SN field shall be protected by the PDU security mechanism to make any change detectable.
- Upon receipt of an ENC, the NFC-SEC Entity shall extract the SN field and compare it with its SNV. If $SN \neq SNV$, then the PDU shall not be submitted to the NFC-SEC User but discarded, and the state and SNV shall remain unchanged as specified in A.4.4.
- The NFC-SEC entity shall increase its SNV by 1.

The 'PDU content valid?' condition in A.4.4 shall be true if SN equals SNV and false otherwise.

NOTE In case of sequence integrity errors, NFC-SEC aborts the SCH and notifies both peer-NFC-SEC-USERS of the incident. It is up to the NFC-SEC-USERS to re-establish a SCH with new keys or to abort the transaction.

12.4 Cryptographic Processing

Before sending and after receipt of PDUs other than TMN and ERROR, cryptographic processing occurs as specified by the cryptography standard identified by the PID. If the outcome of the cryptographic processing of incoming PDUs is negative, then the 'PDU content valid' decision in Annex A is false.

Annex A

(normative)

Protocol Machine Specification

The NFC-SEC protocol machine in this Annex specifies the sequence of PDUs to establish and terminate the SSE, and to establish, use and terminate the SCH.

In addition the Protocol machine specifies which PDUs may be sent or received in which state.

A.1 SDL Symbols

NFC-SEC-PDU received from the peer NFC-SEC entity, delivered by the local NFCIP-1 entity.

NFC-SEC-PDU sent to the peer NFC-SEC entity, submitted to the local NFCIP-1 entity.

NFC-SEC-SDU obtained from the NFC-SEC User, requesting the NFC-SEC entity to perform an action.

NFC-SEC-SDU submitted to the NFC-SEC User, either in response to a previous request or to indicate an event.

State. In a state the protocol machine awaits an event. Events not foreseen in the diagrams constitute protocol errors.

A branching condition in the processing of events.

A.2 Request SDUs

Request SDUs are submitted by NFC-SEC Users to request the NFC-SEC service. Parameters are given in brackets. Requirements on the parameter values are specified in NFC-SEC cryptography standards.

NOTE The actual implementation method of the request primitives (e.g. method calls, inter-process PDUs), is outside the scope of this International Standard.

Service Invocation

Request the invocation of a new service (type of service, PID).

Send Data	Request the sending of data. Admitted only to SCH (data).
Retrieve Data	Request the retrieval of data received. Admitted only to SCH.
Retrieve Secret	Request the retrieval of a shared secret established. Admitted only to SSE.
Terminate	Request termination of service (type of service).

A.3 Confirm SDUs

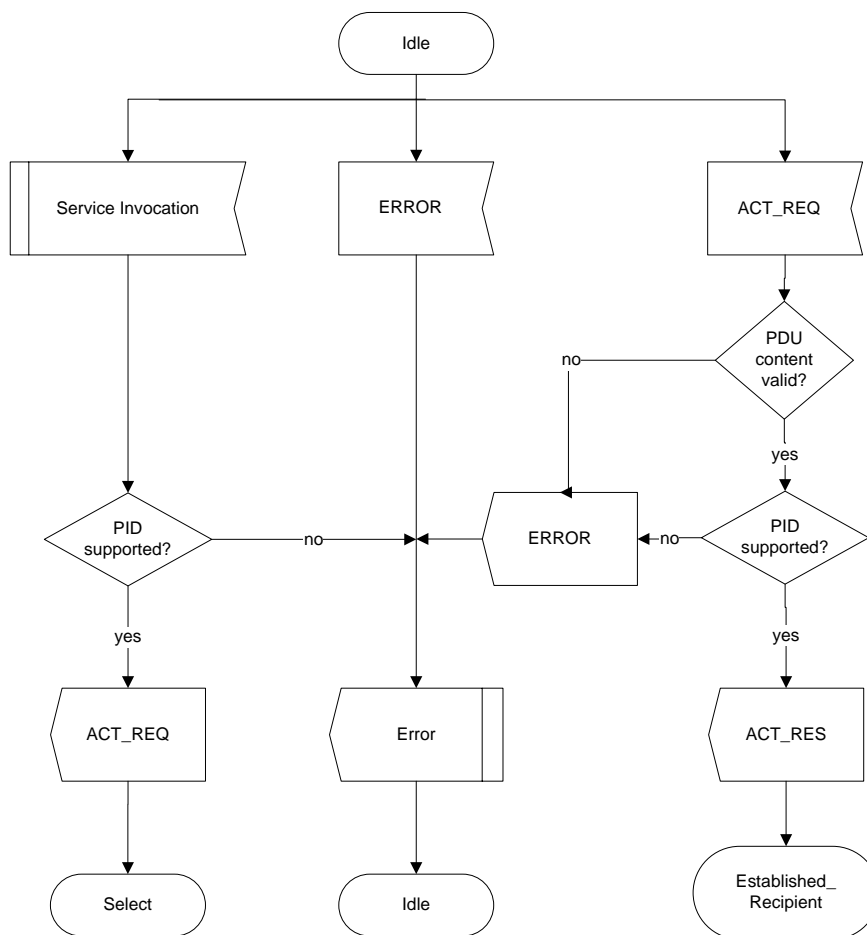

Confirm SDUs are submitted by NFC-SEC entities to NFC-SEC Users. Parameters are given in brackets. Requirements on the parameter values are specified in NFC-SEC cryptography standards.

NOTE The actual implementation method of the confirm primitives (e.g. method calls, inter-process PDUs), is outside the scope of this International Standard.

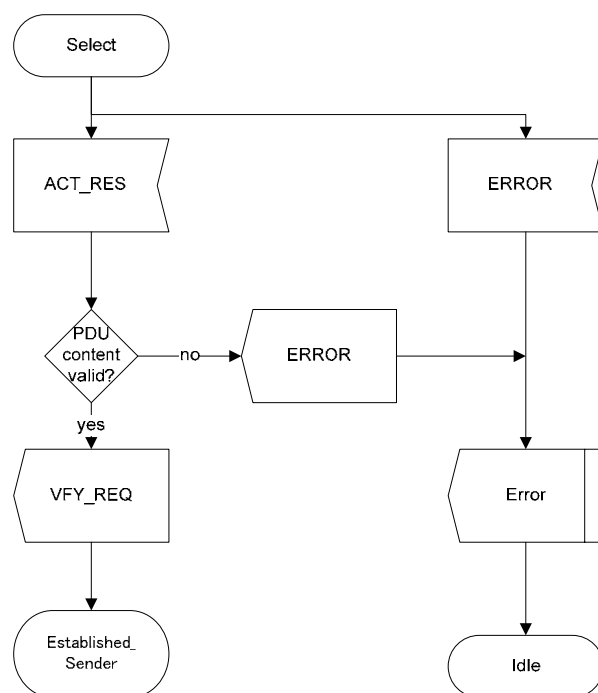

Established	Indicates the successful establishment of a service (type of service).
Data Sent	Indicates the result of a Send Data request (status). This result may be positive or negative, the latter due to a send error, or because the NFC-SEC entity was not ready for sending.
Data Available	Indicates the receipt of data.
Return Data	Response to a Retrieve Data request (data).
Return Secret	Response to a Retrieve Secret request (shared secret).
Terminated	Indicates to a user the termination of a service (type of service).
Error	Indicates an error during processing of a request or a PDU, or any other error. The parameters may reflect the error reason and details (details).

A.4 SDL Diagrams

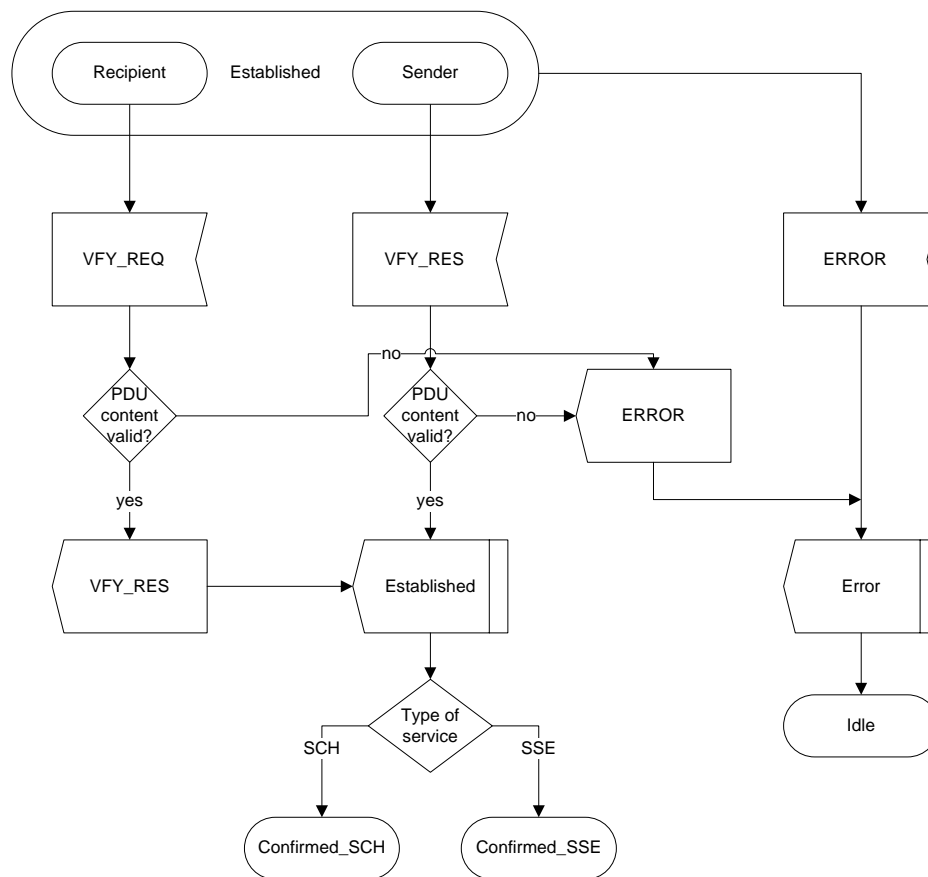

A.4.1 Idle State

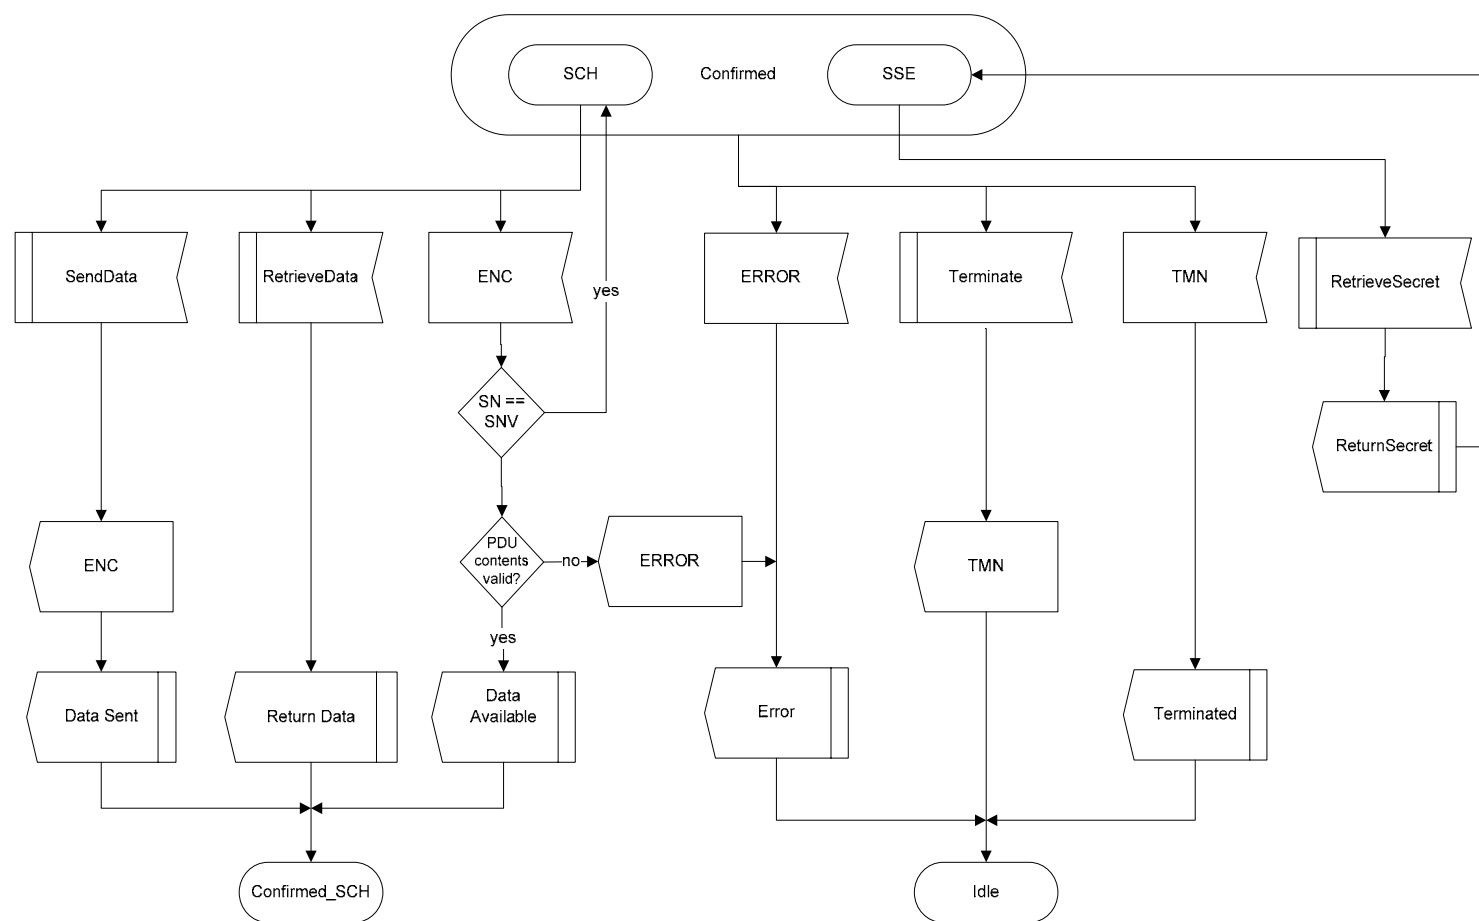

A.4.2 Select State

A.4.3 Established State

A.4.4 Confirmed State

Annex B

(normative)

Additional requirements when using NFC-SEC and ISO/IEC 18092:2004 (NFCIP-1)

When using this International Standard for ISO/IEC 18092:2004 implementations, the following additional requirements shall apply.

These additional requirements are stated in B.4 relate to the following functions:

B.1 The method by which NFCIP-1 devices indicate their support of NFC-SEC

An initiator indicates its support of NFC-SEC with the SECI field in the ATR_REQ.

A target indicates its support of NFC-SEC with the SECT field in the ATR_RES.

For the definitions of the SECI and SECT fields, see B.4.

B.2 Introduction of Protected PDU

Additional Protected PDUs are used in the data exchange protocol as specified in B.4.

B.3 Extension of PDU numbering rules for Protected PDU

Protected PDUs are included in the rules for numbering PDUs as specified in B.4.

B.4 NFCIP-1 amendments

The following amendments to ISO/IEC 18092:2004 shall apply:

Replace in 12.5.1.1.1 the definition of Byte 13: PPI, Figure 29 and Table 20 by the following:

"Byte13: PPI

The PPI byte specifies optional parameters used by Initiator device. The coding of bits is specified in Figure B.1.

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
SECI	RFU	LRi	LRi	RFU	RFU	Gi	NAD

Figure B.1 – Coding of the PPI byte

- bit 7: SECI. The initiator shall set SECI to ONE if it supports NFC-SEC; ZERO indicates no support
- bit6: RFU. The Initiator shall set it to ZERO. The Target shall ignore it.
- bit 5 and bit 4: Length Reduction value.

Table B.1 – Definition of LRi

LRi	LEN _{MAX}
00	Transport data field max length is 64
01	Transport data field max length is 128
10	Transport data field max length is 192
11	Transport data field max length is 254

- bit 3 and bit 2: RFU. The Initiator shall set it to ZERO. The Target shall ignore it.
- bit 1: If bit is set to ONE then it indicates General bytes are available.
- bit 0: If bit is set to ONE then it indicates the Initiator uses NAD."

Replace in 12.5.1.2.1 the definition of Byte 14: PPt, Figure 34 and Table 21 by the following:

"The PPt byte specifies optional parameters used by Target device. The coding of bits shall be as follows:

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
SECT	RFU	LRt	LRt	RFU	RFU	Gt	NAD

Figure B.2 – Coding of the PPt byte

- bit 7 SECT The target shall set SECT to ONE if it supports NFC-SEC; ZERO indicates no support
- bit 6: RFU. The Target shall set it to ZERO. The Initiator shall ignore it.
- bit 5 and bit 4: Length Reduction value.

Table B.2 – Definition of LRt

LRt	LEN _{MAX}
00	Transport data field max length is 64
01	Transport data field max length is 128
10	Transport data field max length is 192
11	Transport data field max length is 254

- bit 3 and bit 2: RFU. The Initiator shall set it to ZERO. The Target shall ignore it.
- bit 1: If bit is set to ONE then it indicates General bytes available.
- bit 0: If bit is set to ONE then it indicates the Target uses NAD."

Replace in 12.6.1.1.1 the definition of Byte 0:PFB, Table 24 by the following

"Byte 0: PFB

The PFB byte shall contain bits to control the data transmission and error recovery. The PFB byte is used to convey the information required controlling the transmission. The data exchange protocol defines these fundamental types of PDU's:

- Information PDU's to convey information for the application layer.
- Protected PDU's to convey protected information
- Acknowledge PDU's to convey positive or negative acknowledgements. An Acknowledge PDU never contains a data field. The acknowledgement relates to the last received block.
- Supervisory PDU's to exchange control information between the Initiator and the Target. Two types of supervisory PDU's are defined.
 - Timeout extensions containing a 1 byte long data field.
 - Attention containing no data field.

The coding of PFB depends on its type and is defined in Table B.3.

Table B.3 – Coding of the PFB bits 7 to 5

bit 7	bit 6	bit 5	PFB
0	0	0	Information PDU
0	0	1	Protected PDU
0	1	0	Acknowledge PDU
1	0	0	Supervisory PDU
Other settings are RFU			

"

Add in 12.6.1.1.1 the definition of a Protected PDU and add Figure B.3 as follows:

"Definition of the Protected PDU:

bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0
RFU	RFU	ONE	MI	NAD	DID	PNI	PNI

Figure B.3 – Coding of the Protected PDU

- bit 7 to bit 6: RFU. The Initiator shall set it to ZERO. The Target shall ignore it.
- Bit 5: Shall be set to ONE
- bit 4: If bit set to ONE then it indicates Multiple Information chaining activated.
- bit 3: If bit set to ONE then it indicates NAD available.
- bit 2: If bit set to ONE then it indicates DID available.
- bit 1 and bit 0: PNI packet number information.

The Packet Number Information (PNI) counts the number of packet send by the Initiator to the Target and vice versa starting by 0. These bytes are used for error detection during the protocol handling."

Replace 12.6.1.2 by the following:

"12.6.1.2 Handling of PDU number information

12.6.1.2.1 Initiator rules

The PNI of the Initiator shall be initialized for each Target with all ZEROs.

When an Information, Protected or Acknowledge PDU with an equal PNI is received, the Initiator shall increment the current PNI for that Target before optionally sending a new frame.

12.6.1.2.2 Target rules

The PNI of the Target shall be initialized with all ZEROs.

When an Information, Protected or Acknowledge PDU with an equal PNI was received the Target shall send its response with this PNI and shall increment the PNI afterwards."

Replace 12.6.1.3.1 by the following:

"12.6.1.3.1 General rules

The first PDU shall be sent by the Initiator.

When an Information or Protected PDU indicating more information is received the PDU shall be acknowledged by an Acknowledge PDU (ACK) .

Supervisory PDUs are only used in pairs. A Supervisory Request shall always be followed by a Supervisory Response."

Replace 12.6.1.3.3 by the following:

"12.6.1.3.3 Target rules

The Target is allowed to send a Supervisory PDU (RTO) instead of an Information PDU.

When an Information or Protected PDU not containing chaining is received it shall be acknowledged by an Information or Protected PDU.

When an Acknowledge PDU (NACK) is received, if the PNI is equal to the PNI of the previous sent PDU, the previous block shall be re-transmitted.

When an erroneous PDU is received the Target shall not answer but stay in same State.

When a Supervisory PDU (Attention) is received, the Target shall respond sending a Supervisory PDU (Attention) response."
